

PLANET 1

55 CANCRI E

- Description:** Ultra-hot rocky world with a global lava ocean. This planet is tidally locked, meaning that the same side faces its star at all times.
- Host star:** 55 Cancri A, a Sun-like star (also named Copernicus). It sits in a binary system: a small red-dwarf companion orbits far out.
- System:** One of 5 known planets orbiting 55 Cancri A, and the innermost of them.
- Location:** Constellation Cancer, about 41 light-years from Earth. The star is just bright enough (magnitude about 6) to be glimpsed with the naked eye under dark skies.
- Discovery:** In 2004 by Barbara E. McArthur et al., at the McDonald Observatory.

Datasheet

EXOPLANET DATA		
	TEMPERATURE	~1700 °C
	PRESSURE	Unknown
	ATMOSPHERE	CO, CO ₂
	GRAVITY	2.27 g
	PLANET RADIUS	
	ORBITAL PERIOD	
	SEMI-MAJOR AXIS	
	TRANSIT DEPTH	
	TRANSIT DURATION	

HOST STAR DATA		
	NAME	55 Cancri A
	SPECTRAL TYPE	G8V
	TEMPERATURE	5172 K
	DISTANCE	41 ly
	MASS	0.905 M _☉
	STAR RADIUS	0.943 R _☉
	AGE	10 Gyr
	APPARENT MAGNITUDE	5.95
	NUMBER OF PLANETS	5

SURVIVAL CHALLENGE

Extreme heat and volcanic toxicity

55 Cancri e: single transit

Blue points are simulated brightness measurements (many orbits phase-folded together, like real data); the gold points are binned averages.

55 Cancri e: light curve over several orbits
